COVID-19

When to get tested for COVID-19

Based on current evidence, some symptoms are more likely to be related to COVID-19 than others.

If you or your child have any of the symptoms listed below, follow the instructions.

SYMPTOMS		WHAT TO DO
• Fever (above 38° C) • Chills • Cough	• Loss of sense of smell or taste • Difficulty breathing	1 or more of these symptoms: Get tested and stay home.
• Sore throat • Loss of appetite • Headache • Body aches	• Extreme fatigue or tiredness • Nausea or vomiting • Diarrhea	If you have 1 symptom: Stay home until you feel better. 2 or more of these symptoms: Stay home and wait 24 hours to see if you feel better. Get tested if not better after 24 hours.
If you are a close contact* of someone who has COVID-19 and have any of the symptoms listed above: Get tested and stay home.		
Check your symptoms with the B.C. Self-Assessment Tool. If you have any questions, or the symptoms get worse, contact your healthcare provider or call 8-1-1.		

★ You will be notified if you are a close contact. For more information on close contacts, go to <http://www.bccdc.ca/covid19closecontacts>

For more information on COVID-19, go to www.bccdc.ca

If you develop severe symptoms, such as difficulty breathing (e.g. struggling to breathe or speaking in single words) or chest pain, **call 9-1-1 or go to the nearest Emergency Department.**

Abstract

Assessing the effectiveness of non-pharmaceutical interventions (NPIs) to mitigate the spread of SARS-CoV-2 is critical to inform future preparedness response plans. Here we quantify the impact of 6,068 hierarchically coded NPIs implemented in 79 territories on the effective reproduction number, R_t , of COVID-19. We propose a modelling approach that combines four computational techniques merging statistical, inference and artificial

Safety and Efficacy of the BNT162b2 mRNA Covid-19 Vaccine

Fernando P. Polack, M.D., Stephen I. Thomas, M.D., Nicholas Kitchin, M.D.,

ABSTRACT

METHODS

In an ongoing multinational, placebo-controlled, observer-blinded, pivotal efficacy trial, we randomly assigned persons 16 years of age or older in a 1:1 ratio to receive two doses, 21 days apart, of either placebo or the BNT162b2 vaccine candidate (30 µg per dose). BNT162b2 is a lipid nanoparticle–formulated, nucleoside-modified RNA vaccine that encodes a prefusion stabilized, membrane-anchored SARS-CoV-2 full-length spike protein. The primary end points were efficacy of the vaccine against laboratory-confirmed Covid-19 and safety.

RESULTS

A total of 43,548 participants underwent randomization, of whom 43,448 received injections: 21,720 with BNT162b2 and 21,728 with placebo. There were 8 cases of Covid-19 with onset at least 7 days after the second dose among participants assigned to receive BNT162b2 and 162 cases among those assigned to placebo; BNT162b2 was 95% effective in preventing Covid-19 (95% credible interval, 90.3 to 97.6). Similar vaccine efficacy (generally 90 to 100%) was observed across subgroups defined by age, sex, race, ethnicity, baseline body-mass index, and the presence of coexisting conditions. Among 10 cases of severe Covid-19 with onset after the first dose, 9 occurred in placebo recipients and 1 in a BNT162b2 recipient. The safety profile of BNT162b2 was characterized by short-term, mild-to-moderate pain at the injection site, fatigue, and headache. The incidence of serious adverse events was low and was similar in the vaccine and placebo groups.

CONCLUSIONS

A two-dose regimen of BNT162b2 conferred 95% protection against Covid-19 in persons 16 years of age or older. Safety over a median of 2 months was similar to that of other viral vaccines. (Funded by BioNTech and Pfizer; ClinicalTrials.gov number, NCT04368728.)

Efficacy and Safety of the mRNA-1273 SARS-CoV-2 Vaccine

L.R. Baden, H.M. El Sahly, B. Essink, K. Kotloff, S. Frey, R. Novak, D. Diemert,

ABSTRACT

METHODS

This phase 3 randomized, observer-blinded, placebo-controlled trial was conducted at 99 centers across the United States. Persons at high risk for SARS-CoV-2 infection or its complications were randomly assigned in a 1:1 ratio to receive two intramuscular injections of mRNA-1273 (100 µg) or placebo 28 days apart. The primary end point was prevention of Covid-19 illness with onset at least 14 days after the second injection in participants who had not previously been infected with SARS-CoV-2.

RESULTS

The trial enrolled 30,420 volunteers who were randomly assigned in a 1:1 ratio to receive either vaccine or placebo (15,210 participants in each group). More than 90% of participants received both injections, and 2.2% had evidence (serologic, virologic, or both) of SARS-CoV-2 infection at baseline. Symptomatic Covid-19 illness was confirmed in 185 participants in the placebo group (56.5 per 1000 person-years; 95% confidence interval [CI], 48.7 to 65.3) and in 11 participants in the mRNA-1273 group (3.3 per 1000 person-years; 95% CI, 1.7 to 6.0); vaccine efficacy was 94.1% (95% CI, 89.3 to 96.8%; $P<0.001$). Efficacy was similar across key secondary analyses, including assessment 14 days after the first dose, analyses that included participants who had evidence of SARS-CoV-2 infection at baseline, and analyses in participants 65 years of age or older. Severe Covid-19 occurred in 30 participants, with one fatality; all 30 were in the placebo group. Moderate, transient reactogenicity after vaccination occurred more frequently in the mRNA-1273 group. Serious adverse events were rare, and the incidence was similar in the two groups.

CONCLUSIONS

The mRNA-1273 vaccine showed 94.1% efficacy at preventing Covid-19 illness, including severe disease. Aside from transient local and systemic reactions, no safety concerns were identified. (Funded by the Biomedical Advanced Research and Development Authority and the National Institute of Allergy and Infectious Diseases; COVE ClinicalTrials.gov number, NCT04470427.)

Efficacy and Safety of the mRNA-1273 SARS-CoV-2 Vaccine

L.R. Baden, H.M. El Sahly, B. Essink, K. Kotloff, S. Frey, R. Novak, D. Diemert,

ABSTRACT

METHODS

This phase 3 randomized, observer-blinded, placebo-controlled trial was conducted at 99 centers across the United States. Persons at high risk for SARS-CoV-2 infection or its complications were randomly assigned in a 1:1 ratio to receive two intramuscular injections of mRNA-1273 (100 μ g) or placebo 28 days apart. The primary end point was prevention of Covid-19 illness with onset at least 14 days after the second injection in participants who had not previously been infected with SARS-CoV-2.

RESULTS

The trial enrolled 30,420 volunteers who were randomly assigned in a 1:1 ratio to receive either vaccine or placebo (15,210 participants in each group). More than 96% of participants received both injections, and 2.2% had evidence (serologic, virologic, or both) of SARS-CoV-2 infection at baseline. Symptomatic Covid-19 illness was confirmed in 185 participants in the placebo group (56.5 per 1000 person-years; 95% confidence interval [CI], 48.7 to 65.3) and in 11 participants in the mRNA-1273 group (3.3 per 1000 person-years; 95% CI, 1.7 to 6.0); vaccine efficacy was 94.1% (95% CI, 89.3 to 96.8%; $P < 0.001$). Efficacy was similar across key secondary analyses, including assessment 14 days after the first dose, analyses that included participants who had evidence of SARS-CoV-2 infection at baseline, and analyses in participants 65 years of age or older. Severe Covid-19 occurred in 30 participants, with one fatality; all 30 were in the placebo group. Moderate, transient reactogenicity after vaccination occurred more frequently in the mRNA-1273 group. Serious adverse events were rare, and the incidence was similar in the two groups.

CONCLUSIONS

The mRNA-1273 vaccine showed 94.1% efficacy at preventing Covid-19 illness, including severe disease. Aside from transient local and systemic reactions, no safety concerns were identified. (Funded by the Biomedical Advanced Research and Development Authority and the National Institute of Allergy and Infectious Diseases; COVE ClinicalTrials.gov number, NCT04470427.)

A Per-Protocol Analysis

B Modified Intention-to-Treat Analysis

VE derived from 14 days after dose 1 to dose 2 = 94.3% (95%CI: 76.2-98.6) [before dose 2]

VE reported by Moderna from 14 days after dose 1 = 95.2% (95%CI: 91.2-97.4) [includes dose 2]

2nd Dose Deferral? Skeptical or Curious

Some Principles... Now you decide...

- Roles and Interest
 - Manufacturer
 - Regulators (Assess evidence)
 - Vaccinologists and Vaccine Effectiveness researchers
- Vaccinology
 - Prime and Boost immune response science
 - Immune response mechanism to SARS-CoV-2 – adaptive, T cell, B cell, innate, cytokine
 - Development of vaccine
 - Short release, heightened safeties, longer studies in the future
 - Post market analysis
 - Opportunity to learn from other countries

First and second dose interval

- **Minimum intervals between 1st and 2nd dose are generally specified (i.e. no shorter than ...)**
 - For most vaccines of the Canadian immunization schedule minimum interval is 4 weeks
 - For some, minimum interval recommended is 8 weeks, 3 months or 6 months
- **Max intervals between 1st and 2nd dose are not generally specified (i.e. no longer than ...)**
 - In general, longer interval between first and second doses results in higher antibody responses which are associated with longer lasting protection
 - Examples:
 - **Pandemic influenza vaccine candidates:**
 - Beran J et al Clinical Therapeutics 2010;32(13):2186-97 [MF59 H5N1 vaccine]
 - Belshe RB et al J Infect Dis 2011;203:666-73 [H5 heterologous responses]
 - Ledgerwood JE J Infect Dis 2013;208:418-22 [H5 DNA vaccine]
 - **Pneumococcal vaccine (PPSV23):**
 - Kawakami K et al Human Vaccines & Therapeutics 2018;14(8):1931-38
 - **Measles, mumps, rubella, varicella:**
 - Rümke HC et al Vaccine 2011;29:3842-49
 - **Human papillomavirus (HPV):**
 - Widdice LE et al Vaccine 2018;36(6):881-89

Recommendations elsewhere: interval of 12 weeks or more

- Joint Committee on Vaccination and Immunisation (JCVI), United Kingdom, December 30, 2020:
 - “...given data indicating high efficacy from the first dose of both Pfizer-BioNTech and AstraZeneca vaccines, the Committee advises that delivery of the first dose to as many eligible individuals as possible should be initially prioritised over delivery of a second dose. This should maximize the short-term impact of the programme. **The second dose of the Pfizer-BioNTech vaccine may be given 3 to 12 weeks following the first dose. The second dose of the AstraZeneca vaccine may be given between 4 to 12 weeks following the first dose.**”
 - https://assets.publishing.service.gov.uk/government/uploads/system/uploads/attachment_data/file/948338/jcvi-advice-on-priority-groups-for-covid-19-vaccination-30-dec-2020.pdf
- Quebec Immunization Committee (QIC), December 31, 2020:
 - Deferral of second dose until all members of their six priority groups have had opportunity to receive at least one dose
 - Reassess based on field evaluation of vaccine performance; recent Ministry announcement of 90 day interval
 - <https://www.inspq.qc.ca/publications/3098-strategie-vaccination-2e-dose-covid>

Recommendations elsewhere: interval of 6 weeks

- World Health Organization, January 8, 2021
 - Interval between doses may be extended up to 42 days (6 weeks) on the basis of available clinical trial data
 - Countries should ensure that any such program adjustments to dose intervals do not affect the likelihood of receiving the second dose
 - https://assets.documentcloud.org/documents/20445916/who-2019-ncov-vaccines-sage_recommendation-bnt162b2-20211-eng.pdf
- European Medicines Agency
 - Interval between first and second doses of the mRNA vaccines should not exceed 42 days (adopted by France, Denmark, Netherlands)
 - <https://www.bmj.com/content/372/bmj.n18>
- Canadian National Advisory Committee on Immunization, January 8, 2021
 - Options for extending the interval based upon local epidemiology and vaccine supply, preferably 42 days
 - <https://www.canada.ca/en/public-health/services/immunization/national-advisory-committee-on-immunization-naci/recommendations-use-covid-19-vaccines.html>

COVID Vaccination

- Goals
 - Protect the most vulnerable from serious illness and death
 - Sustain health care system capacity
- Strategy
 - Considers epidemiology and burden
 - Resources
 - Ethics, evidence, logistics
- Impact
 - Depends on Vaccine Efficacy and Coverage rates

High-risk groups

- LTCF / ALF residents: ~60% of deaths
- Health care workers [4% of BC population 20-64 years; 10% of COVID-19 cases]
 - Implications for health care system capacity and caring for others
- 80+ years [5% population; 5% cases]
 - 17% of hospitalizations
 - 11% of ICU admissions
 - 71% of deaths
- 70-79 years [5% population; 5% cases]
 - 21% of hospitalizations
 - 26% of ICU admissions
 - 19% of deaths
- 60-69 years [13% population; 8% cases]
 - 18% of hospitalizations
 - 26% of ICU admissions
 - 19% of deaths

See: [http://www.bccdc.ca/Health-Info-Site/Documents/COVID_sitrep/Week 2 2021 BC COVID-19 Situation Report.pdf](http://www.bccdc.ca/Health-Info-Site/Documents/COVID_sitrep/Week_2_2021_BC_COVID-19_Situation_Report.pdf)

In December: 180 hospitalizations, 47 ICU admissions and 35 deaths due to COVID-19 among community-dwelling 70-79 yos in BC

- **Compared to those 80+ years:**
 - Similar number of hospitalizations and more ICU admissions
 - Fewer deaths
 - A larger proportion of severe outcomes involve non-LTCF/ALF

Age in years	LTCF / ALF residents			Non-LTCF/ALF			Total		
	Hospitalized	ICU	Death	Hospitalized	ICU	Death	Hospitalized	ICU	Death
80+	53	3	221	173 (77%)	23 (88%)	71 (24%)	226	26	292
70-79	16	2	44	180 (92%)	47 (96%)	35 (44%)	196	49	79

Percent of priority individuals who could be vaccinated by end of March 2021, inclusive of elderly adults 70-79 years

Assumes 75% who are offered vaccine will take it
Illustration based on anticipated supply and roll-out; subject to change

How community immunity works

Disease spreads quickly when no one is immunized.

The spread of disease is contained when most people are immunized.

Administered Doses for Priority Populations

We are in

Phase 1

Dec 2020 - Feb 2021

Phase 2

Feb - Mar 2021

Phase 3

April - June 2021

Phase 4

July - Sept 2021

High-risk population

General population

Phase 1

Phase 1 (Current phase)

Timeline: December 2020 to February 2021

- Residents and staff of long-term care facilities
- Individuals assessed for and awaiting long-term care
- Residents and staff of assisted living residences
- Essential visitors to long-term care facilities and assisted living residences
- Hospital health care workers who may provide care for COVID-19 patients in settings like Intensive Care Units, emergency departments, paramedics, medical units and surgical units
- Remote and isolated Indigenous communities

Phase 2

Phase 2

Timeline: February to March 2021

- Seniors aged 80 and over who are not immunized in Phase 1
- Indigenous (First Nations, Métis and Inuit) seniors age 65 and over, Elders and additional Indigenous communities not immunized in Phase 1
- Hospital staff, community general practitioners (GPs) and medical specialists not immunized in Phase 1
- Vulnerable populations living and working in select congregated settings
- Staff in community home support and nursing services for seniors

What's next?

- Getting ready for mass immunization.
 - Preparing for nurse, pharmacist and physician immunizers on large scale
 - Immunization competency courses available at BCCDC for CME credit
- Prepare to counsel patients.
 - Immunization readiness and hesitancy
 - Considerations prior to immunization
- Respond to adverse events following immunization
 - Reporting guidance in BCCDC Immunization Manual Chapter 5

Immunization Competency Courses

BCCDC

- Immunization Competency Course
 - Comprehensive course
 - Knowledge necessary to provide safe and effective immunization programs

Canadian Pediatric Society (CPS)

- Education Program for Immunization Competencies (EPIC) course
 - Condensed immunization competency process for **NEW vaccine providers**
 - Administration of COVID-19 vaccine only

Immunization Competency Course

Purpose: To equip new immunizers with the knowledge necessary to provide safe and effective Immunization programs based on the Public Health Agency of Canada's (PHAC) immunization competencies. This course is employer mandated in some practice settings. Please consult your health professional's regulatory body as well as your employer who can advise you of respective requirements in order to safely administer immunizations.

Intended Audience: RNs (e.g. PHNs, travel nurses, vaccine trial nurses, OHNs), RPNs, LPNs, Pharmacists, and Naturopathic Physicians.

Website: PHSA [LearningHub](#)

BCCDC offers an on-line course for immunization providers. The course is available to Registered Nurses, Registered Psychiatric Nurses, Licensed Practical Nurses, Pharmacists, and Naturopathic Physicians. Please see below for additional information about this course by profession.

Immunization has saved more lives in Canada in the last 50 years than any other health measure.

What are the COVID-19 mRNA vaccines?

The COVID-19 mRNA vaccines protect against infection from the severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) that causes COVID-19. The vaccines cause your body to produce antibodies that will protect you from getting sick if exposed to the virus. Health Canada approved the vaccines.

Who should get the vaccines?

The vaccines are being provided to those who are at increased risk of exposure to the virus and those most at risk of serious complications. The vaccines will only be available for certain groups of people at first due to limited supply of the vaccines. As the vaccine supply increases other groups of people will be able to get the vaccine. For information on when a vaccine will be

immunization record when returning for your second dose.

What should I do after I get the vaccine?

After you get the vaccine, continue to follow public health recommendations such as:

- Wash your hands or use hand sanitizer
- Physical distance
- Wear a mask where required

You should not receive any other vaccines until 28 days have passed after you receive the second dose of the COVID-19 vaccine.

What are the benefits of the vaccines?

The vaccine are the best way to protect you against COVID-19 which is a serious and sometimes fatal disease. In clinical trials, those who received the vaccines were about 95% less likely to become sick with COVID-19. When you get immunized, you help protect others as well.

Addressing vaccine hesitancy

- Understand concern and question
- Respond using short & simple key messages
- Present risks and benefits of the vaccine fairly
- Use a presumptive statement
- Remember that the strength of a HCPs recommendation can help move someone who is hesitant toward acceptance of vaccination

Key considerations

Communication is key

- Cultural safety
 - Trauma informed
 - Language equity
-
- ✓ Consider knowledge, attitudes, and beliefs
 - ✓ Provide clear, concise messages
 - ✓ language considerations
 - ✓ Direct to evidence-based resources

Discretionary NACI recommendations

- Persons with an autoimmune condition
 - COVID-19 vaccine may be offered to individuals with an **autoimmune condition** if a risk assessment deems that the **benefits outweigh the potential risks** for the individual, and **if informed consent includes discussion about the insufficiency of evidence on the use of COVID-19 vaccine in these populations**
- Immunosuppressed persons
 - COVID-19 vaccine may be offered to individuals who are **immunosuppressed due to disease or treatment** if a risk assessment deems that the benefits outweigh the potential risks for the individual, and if informed consent includes discussion about the absence of evidence on the use of COVID-19 vaccine in this population
- Pregnancy and breastfeeding
 - COVID-19 vaccine may be offered if a risk assessment deems that the benefits outweigh the potential risks for the **individual and the fetus/infant**, and if informed consent includes discussion about the absence of evidence on the use of COVID-19 vaccine in this population

Discretionary NACI recommendations

- There are no data on COVID-19 vaccination in individuals who are immunosuppressed/pregnant/breast feeding and limited data for autoimmune conditions
- No safety signals of concern have been noted in non-immunosuppressed participants with an immunocompromising condition (e.g., stable HIV infection)
- Immunocompromised persons may have a diminished immune response
- In general, non-replicating vaccines may be administered to immunocompromised and pregnant people because the antigens in the vaccine cannot replicate
- People living with HIV that are considered immunocompetent may be vaccinated
- There is a theoretical risk of exacerbation of some autoimmune conditions
- No theoretical concerns about these vaccines and breastfeeding
- To date no evidence of harm in pregnancy from animal studies
- Balance of benefits and risks must be made case-by-case

Vaccine safety monitoring

How a vaccine's safety is continuously monitored

The purpose of ongoing vaccine safety monitoring is to detect possible adverse events that would occur very rarely, too rarely to have been detected even in a large clinical trial.

Adverse Events Following Immunization

Reporting Adverse Events Following Immunization

For BC Community Vaccine Providers

DO YOUR PART IN REPORTING ADVERSE EVENTS!

1

Advise patients to inform you if they experience a concerning adverse event after vaccination.

2

Report to public health any reportable event using BC's Adverse Events Following Immunization (AEFI) Case Report Form.

3

Follow up with your patient to advise about whether they can proceed with future immunizations.

4

Contact your local public health unit if you have any questions about AEFI reporting.

Questions & Answers

What is an AEFI?

An adverse event following immunization (AEFI) is any untoward medical occurrence following the administration of a vaccine which may or may not be caused by the vaccine.

What type of AEFIs should be reported?

Any event which may be related to receipt of a vaccine, as outlined in [BC's AEFI Case Report Form](#).

Why is it important to report AEFIs?

AEFI reporting provides vital information needed to monitor vaccine safety. This type of surveillance can detect rare side effects and identify safety signals not detectable through clinical trials.

What happens after AEFIs are reported?

As a vaccine provider, you will receive information about the event and the next steps.

Who should report AEFIs?

Health professionals who are aware of an adverse event following immunization must report the event to the local public health unit using BC's [AEFI Case Report Form](#).

What do I tell my patients about AEFIs?

Patients should be made aware of potential vaccine side effects and know the importance of reporting any adverse events.

In general, the following events should not be reported:

- Local injection site reactions
- Non-specific systemic reactions
- Events that have another obvious cause (for example, co-existing conditions)

A detailed table of reportable AEFIs with temporal criteria can be found on page 7 of the BCCDC AEFI guide:

COVID-19 (mRNA) COVID-19 mRNA Vaccine mRNA-1273 Supplier: Moderna

INDICATIONS:

- Vaccination will occur in phases. Sequencing of populations for whom the vaccine is currently indicated in British Columbia is available on the BCCDC [COVID-19 Vaccine Eligibility](#) page.

The vaccine is not approved for use in those less than 18 years of age.

DOSES AND SCHEDULE:

Adults 18 years of age and older: 2 doses given as 0.5 mL IM, 28 days apart. ^{A, B, C}

ADMINISTRATION:

No reconstitution required.

Storage and Handling:

- The vaccine can be stored at:
 - -20°C (-25°C to -15°C) up to the end of its expiry date, kept in the original packaging and protected from light. Do not store on dry ice.
 - +2°C to +8°C for up to 30 days prior to first use, protected from light.
 - Room temperature (up to +25°C) for up to 12 hours.
 - After first vial puncture, the vaccine must be used **within 6 hours**.
 - The vaccine can be pre-loaded into a syringe for up to 6 hours.
 - Ensure that the vial/syringe is clearly labelled with the date and time of first vial entry.
- Product should be thawed/held prior to use, in one of the following three ways:
 - From the freezer to room temperature; will require 1 hour to thaw
 - From the freezer to the refrigerator; will require 2 hours and 30 minutes to thaw, and then requires at least 15 minutes at room temperature prior to administration.
 - Swirl the vial gently after thawing and between each withdrawal. Do not shake.
- Do not refreeze thawed vials.

COVID-19 vaccine resources for HCPs

Weighing certainty and uncertainty in the midst of a crisis

- **Certainty**

- Pandemic activity remains elevated and the vast majority of high-risk individuals remain susceptible
 - Absent more drastic measures, there is a clear and present danger with respect to the risk of COVID-19 and associated hospitalizations and deaths
 - Given protective vaccine, comparable with one or two doses, more hospitalizations and deaths could be prevented on the short term through second dose deferral

- **Uncertainty**

- Duration of protection with available COVID-19 vaccines is unknown for one or two dose schedules (follow up for up to four months)
 - Antibody decay unlikely to be sudden; gradual waning
 - Longer intervals between second doses generally preferred
